

Chapter 10: Finance Company Support and User Experience

Learning Bluemix & Blockchain

Bob Dill, IBM Distinguished Engineer, CTO Global Technical Sales
David Smits, Senior Certified Architect, IBM Blockchain

The Plan: 30 minute Chapters with an hour or two of practice

Chapter 1:	What is Blockchain? Concept and Architecture overview
Chapter 2:	What's the story we're going to build
Chapter 2.1:	Architecture for the Story
Chapter 3:	Set up local HyperLedger V1 development environment
Chapter 4:	Build and test the network
Chapter 5:	Administration User Experience
Chapter 6:	Buyer Support and User Experience
Chapter 7:	Seller Support and User Experience
Chapter 8:	Shipper Support and User Experience
Chapter 9:	Provider Support and User Experience
Chapter 10:	Finance Company Support and User Experience
Chapter 11:	Combining for Demonstration
Chapter 12:	Events and Automating for Demonstration

Finance Company View

- Display a simple list of all orders in the network

cancel/exit

Show order details on request

- Expand any order to show it's history upon request
- This uses a CSS 'accordion' action to open the detail when the order # is clicked and to close the detail when either the detail window or an order number is clicked.

CSS for Accordion

- The magic of the accordion is accomplished through the combination of the `acc_body` class and either the `on` or `off` class.
 - `acc_body + on` displays the detail window
 - `acc_body + off` hides the detail window

```
.acc_header.on {  
    color: #000000;    border: .125em solid #298A08; font-size: 1.25em; text-align: center; font-style: bold;  
}  
.acc_body.on {  
    color: #298A08;    border: .125em solid #000000; visibility: visible;  
}  
.acc_header.off {  
    color: #000000;    border: .125em solid #E0F8E0; font-size: 1em; text-align: center; font-style: bold;  
}  
.acc_body.off {  
    color: #A4A4A4;    border: .125em solid #E0F8E0; visibility: hidden; height: 0;  
}
```

javascript for Accordion

- This uses two routines:
 - accToggle activates or deactivates the current accordion. In our case, that means that this routine is invoked every time an order number is clicked to open the related detail window. It's also invoked when an open detail window is clicked.
 - But what happens when a detail window is opened and a different order number is clicked? The invoked behavior is to close the currently opened detail window. This is accomplished via the accOff function.

```
function accToggle(_parent, _body, _header)
{
    var parent = "#" + _parent;
    var body = "#" + _body;
    var header = _header;
    if ($(body).hasClass("on"))
    {
        $(body).removeClass("on"); $(body).addClass("off");
        $(parent).removeClass("on"); $(parent).addClass("off");
    } else
    {
        accOff(parent);
        $(body).removeClass("off"); $(body).addClass("on");
        $(parent).removeClass("off"); $(parent).addClass("on");
    }
}

/**
 *
 */
function accOff(target)
{
    var thisElement = $(target);
    var childNodes = thisElement.children();
    for (each in childNodes)
    {
        var node = "#" + childNodes[each].id;
        if (node != '#')
        {
            if ($(node).hasClass("on")) { $(node).removeClass("on"); }
            $(node).addClass("off");
        }
    }
}
```

FinanceCo HTML

- As with the other user experience files, all text is abstracted to the prompts.json file and populated based on the selected language.

```
<h2 id="title"></h2>
  <div class="scrollingPane showfocus finance">
    <div class="showfocus container" id="financeC0orderDiv">
    </div>
  </div>
  <div class="messagePane" id="finance_messages"></div>
  <div class="bottom-hold"><button class="button-wide showfocus" id="financeC0clear"></button>
  <button class="button-wide showfocus" id="financeC0orderStatus"></button></div>
```

FinanceCo javascript

- The magic of the accordion is accomplished here, at the end of the financeCo.js file. Two key lines have been added which invoke the accToggle function.

```
_target.append(_str);
for (let each in _orders)
  {(function(_idx, _arr)
    {
      $("#f_order"+_idx).on('click', function(){accToggle('financeC0orderDiv','order'+_idx+'_b', 'order'+_idx+'_h');});
      $("#order"+_idx+"_b").on('click', function(){accToggle('financeC0orderDiv','order'+_idx+'_b', 'order'+_idx+'_h');});
      $("#f_btn_"+_idx).on('click', function ()
      {
```
